

Safety Note - Low-Voltage Monitoring Only

Celestial Electric Solar & Battery Room Monitor

Use this as a stand-alone downloadable Safety Note PDF and also paste the same note into the Project Hub description.

Low-voltage monitoring only

This project is for low-voltage monitoring, training, and demonstration only.

Do not connect an Arduino directly to service equipment, PV strings, battery terminals, inverter terminals, generator controls, transfer switches, utility equipment, fire alarm circuits, or any line-voltage wiring.

Any real field installation must use proper listed equipment, isolation, overcurrent protection, enclosures, strain relief, wire separation, and code-compliant wiring methods. Dry-contact monitoring, relay interfaces, current sensors, and auxiliary signals must be installed according to the equipment manufacturer instructions and all applicable electrical codes.

This project is not a replacement for listed safety controls, manufacturer monitoring systems, utility-required protection equipment, fire alarm systems, generator/ATS controls, battery management systems, or code-required protective devices.

Celestial Electric uses this project as a low-voltage monitoring concept, training tool, and demonstration platform only.

Plain-language summary

- Monitor signals only.
- Do not use Arduino as safety-critical control equipment.
- Do not connect Arduino directly to line voltage or power equipment.
- Use listed equipment and code-compliant methods for any real installation.
